# Sap Production Raw Data: St. John’s Maple Syrup Operation 1972-2009 

The data in this table summarize the amount of sap collected by St. John's sugar makers from 1972 until 2009. These data were originally written on scrap lumber "datasheets" and nailed to roof joists in the sugar shack. "Loads of sap" refers to the number of tanks of sap that were collected in the field and brought back to the sugar shack. From 1972 until 2007, the collecting tank had a capacity of 175 gallons. Each time the sugar makers returned a tank load of sap from the field they put a tick mark on the "datasheet." The size of partial loads were estimated in the original tank and were typically recorded as half full ( $0.5=87.5 \mathrm{gal}$.), two-thirds ( $0.67=117$ gal.) or three-quarters full ( $0.75=131 \mathrm{gal}$.$) . To determine the total volume of sap collected the$ number of tick marks was multiplied by the volume of the tanker. In 2008, a new collecting tank was put into service with a capacity of 225 gallons. In 2009 , rather than calculate the sap volume by the number of loads, the actual amount of sap was recorded in each load because the new tank had easy to read markings. Thus, in 2009, the number of loads records the number of times the tractor pulling the tank went into the field and the volume was measured directly from the tank itself. Numbers are rounded to one decimal.

| YEAR | DATE | LOADS <br> OF SAP | GALLONS OF SAP COLLECTED |
